Grease Replenish Program

- patented method for efficient removal of old and hardened grease

80% of all breakdowns in bearing systems are caused by grease problems - either because of decreasing lubricity or unsuitable grease.

Purified grease prolongs bearing life and restores reliability, BUT only if the old, hardened and old grease is carefully removed first.

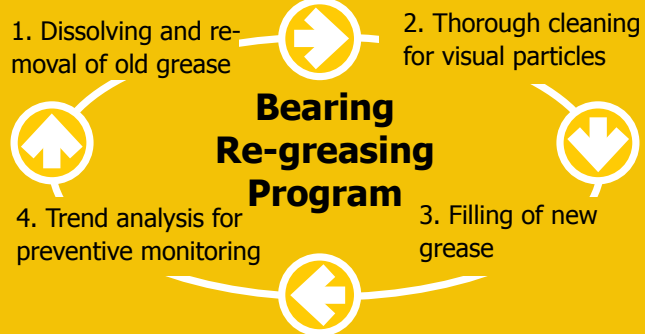

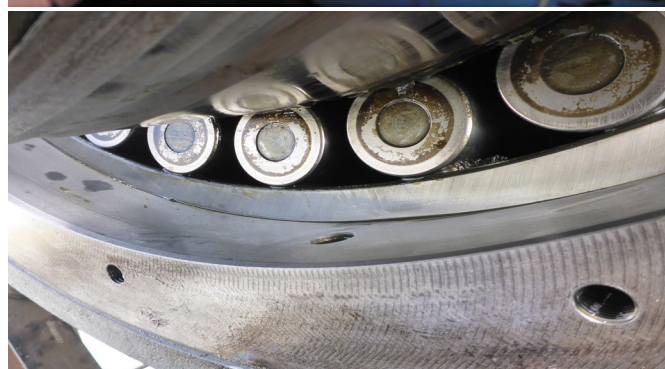

Ocean Team has developed a patented method, which makes re-greasing of bearings much faster, safer and efficient compared to normal procedures.

This Bearing Re-greasing Program includes:

- 1 Dissolving and removal of old grease**
Injection of a corrosion inhibited fluid to dissolve old and hardened grease.
- 2 Thorough cleaning for contamination**
Flushing and filtration of the bearing system for removal of visual particles and remains of the old grease.
- 3 Filling of new grease**
New grease is added to the purified bearing system.
- 4 Trend analysis for preventive monitoring**
An efficient grease analysis program can prevent accelerating wear and possible breakdowns.

A Cost-Saving Patented Method

- Extended lifetime of bearings
- Minimised risks of breakdowns
- Minimised time-consumption
- Increased safety
- Minimised maintenance costs
