

## Patented Method for Online Oil Flushing

- Using Pulse-induced Pressurisation

**Ocean Team has developed a new method for oil flushing, which enables us to clean live systems without closing down production.**

The solution is especially attractive for cleaning of static hydraulic systems like emergency shutdown systems (ESD) and hydraulic wellhead panels on offshore oil and gas platforms. Considerable advantages can be gained from keeping production up and running while the hydraulic systems are flushed by means of turbulent, pulseinduced flow.

### Fluid Conversion Without Shutdown

The patented method can also be used for online fluid conversion in static hydraulic systems. Shutting down production is therefore no longer necessary to carry out change of fluid. The method saves you from huge amounts of money in production loss.

### Advantages

- No production loss during flushing/conversion.
- No interruptions of the general production.
- Maximum system reliability.
- Flexible and mobile equipment.

**"Money-saving Method for Cleaning Your Systems Without Shutdown."**

Online flushing of static hydraulic systems without closing down production. Especially, attractive solution for emergency shutdown systems (ESD) and hydraulic wellhead panels on offshore oil and gas platforms.
